NOTICE OF STUDY COMMENCEMENT

Frankford Water Capacity – Class Environmental Assessment

The City of Quinte West has identified the need for additional water capacity to support recent and planned future growth in the Frankford area. The Frankford Water Treatment Plant (WTP) located on the west side of the Trent River, currently supplies drinking water for the communities of Frankford and Batawa. Areas of Frankford on the east side of the river are serviced by a single watermain crossing on the Frankford bridge (see map).

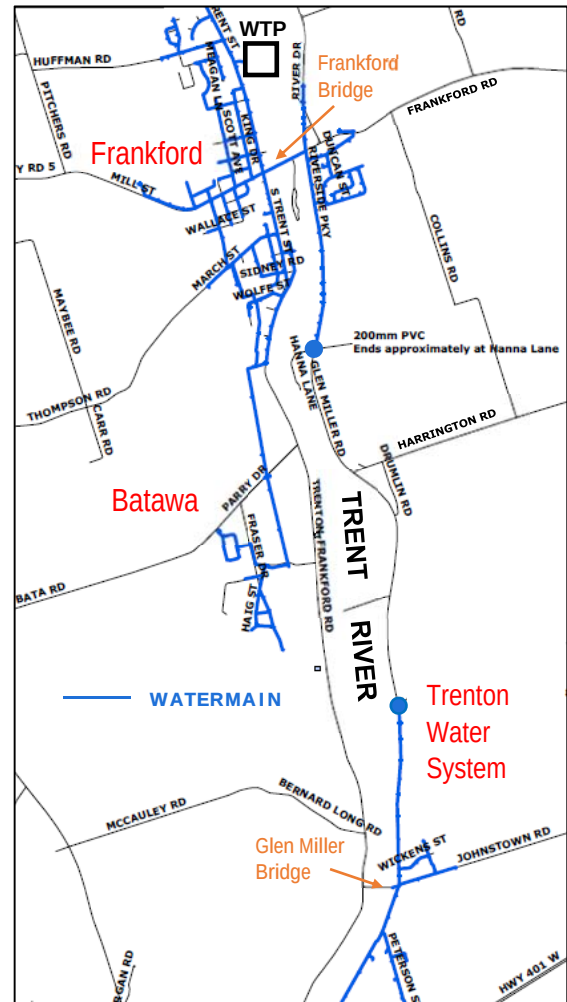

A Class Environmental Assessment (EA) study has been initiated to determine a preferred solution that provides increased water capacity for the Frankford/Batawa water system and addresses concerns related to the single river crossing. Primary options for consideration include expanding the Frankford WTP, or connecting the Frankford and Trenton water systems to provide supplementary capacity from the Trenton and Bayside water treatment plants. Potential watermain connection routes exist along Glen Miller Road on the east side of the river, or across the Glen Miller bridge to Batawa on the west side of the river. A second river crossing at the south end of Frankford near Hanna Lane is also an option.

This project is being planned in accordance with the requirements for a Schedule “B” Municipal Class Environmental Assessment (EA). The Class EA process includes consultation with the public and review agencies, an evaluation of viable alternative solutions, an assessment of the impacts of the alternative solutions, identification of measures to mitigate any adverse impacts, and the selection of a preferred solution.

Public input into the planning and design of this project is encouraged. If you have any comments or questions regarding this project, or would like to receive further information, please send an email to one of the following project contacts:
