How data centers destroy humanity and all living beings. Not only environmental but also spiritual and social aspects. 🌟🌟🙏🙏🌍🌀🌟🌟😞😞😞😞🌊💧🌱🌱🌱👤💙💙💙💙💚💚💚 Thousands of gallons of fuel poured from a storage tank at a large data center in Secaucus, N.J., into a tributary of the Hackensack River. Crews worked over the weekend and have cleaned up about 3,500 gallons so far. This is partly why the rapid expansion of massive data centers must be done carefully and thoughtfully. Thinking about all the potential downstream issues that can arise. Please help me understand, Ilse...what are the spiritual aspects of data centers to which you allude? Thanks in advance! What I don't understand is why a technology that's being touted as bringing in a new world order needs FOSSIL FUEL and doesn't recycle the water it uses, which limits locations of builds. Is there some sort of "tax" on data centers, like an insurance or a fund set aside to address accidents like this? Not that the environment is guaranteed to recover fully from such a spill, but at least an admission that the potential for accidents does exist. What is the real cost of a data center to the community in its vicinity? Since this AI bot isn't providing specifics, here is the story: NYT Gift article https://www.nytimes.com/2026/09/15/nyregion/data-center-diesel-fuel-spill-new-jersey.html?unlocked_article_code=1.CFE.vCy8.3HC43yg0bOxx&smid=nytc0re-ios-share We do have to be very careful, but there can be an accident anyway. We already have environmental spills. This is not a reason to not have AI, which can do a lot of good things too. It's a reason to take greater caution than we have been taking in planning things like data centers. Why is their diesel fuel at a data center?? There are other, cleaner generator options but I'm guessing that the municipality didn't stress using a cleaner option. I am so sad about what is happening to our planet. Everything I am reading and learning about AI, data centers just makes me sick to my stomach. What kind of planet are we leaving for future generations? Who truly benefits besides the billionaires destroying so much and for what? No one is even putting any control or regulations on AI. It is like living in a dystopian novel. A serious spill deserves accountability, investigation, and corrective action. What it does not justify is the intellectually reckless claim that data centers "destroy humanity and all living beings." Updated reporting identified two failed filtration valves—not some sinister consequence of computing—and officials reported no impact to Anderson Creek, its wetlands, or the Hackensack River, with no wildlife impacts reported. Data centers support hospitals, emergency services, banking, research, communications, and the very platform used to publish this post. Criticizing poor safeguards is responsible. Exploiting one equipment failure to demonize an entire critical industry is sensationalism masquerading as environmental concern. Funny how computers too often simply

are rather stupid. A simple smart tv that is anything but smart; a computer that dumps 5,000 gallons of back up diesel in Hackensack river. And people are then necessary to clean up the mess! People should realize data centers are not just ai in fact a Google search uses more water and resources per search than ai Google uses .60 ml per search avg. As ai uses .26 ml water for cooling... Everything on the Internet is data. The question becomes do u want phones technology Internet and things everyone has been accustomed to for decades as ai also isn't new it's been called many things machine learning and AI developed mid 1940s and early 1950s question is who's asking the right questions.... The resources used by one person in just 3 showers now becomes more water than a few million ai prompts. Just one watering your lawn is more than one person uses to cool data centers. Many industries have generator issues and fuel leaking into our environment we don't protest the gas pump We like our vehicles... Time for a recalibrated approach? Yes! Blame one industry for a global infrastructure issue. No Ask uniform and difficult questions in all social economic systems and record the information to make the right decisions... Yes... Ah but where do u keep all the Information so future generations don't have to go through more of the same repeated failures in society? Curious to which resource you use and the industry impact?
